

## TREE AMENITY VALUATION CALCULATION

The following formula has been adapted from the City of Melbourne "Calculating a Tree's Amenity Value" to assist in the determination of a reasonable amount that DCC would be paid by a Developer or resident for the unscheduled removal of a public tree.

This formula only calculates the amenity value of the tree. Further charges including the cost of removal, stump grinding, tree planting and 24 months of establishment costs would be determined and charged separately in most cases.

The tables below relate directly to the "Calculation Sheet".

**Table 1 Species Factor**

| Species Group | Characteristics  |
|---------------|--|
| 1             | trees of short life span (<50yrs), Fast growth. Examples: <i>Prunus, Acacia, Virgilia, Laburnum</i>  |
| 2             | trees of short life span (<50yrs), slow growth. Examples: <i>Malus, Crataegus, Eugenia, Waterhousia, Pyrus</i>   |
| 3             | trees of medium life span (50 – 150 yrs), fast growth rate. Examples: <i>Populus, Liquidamber, Eucalyptus, Angophora, Grevillea, Melaleuca, Michelia, Salix, Casuarina, Hakea, Celtis, Acmena</i>                              |
| 4             | trees of medium life span (50 – 150 yrs), slow growth rate. Examples: <i>Brachychiton, Fraxinus, Gleditsia, Lagunaria, Jacaranda, Shinus, Phoenix, Melia, Robinia, Lophostemon, Lirodendron, Agonis, Metrosideros, Syzgium</i> |
| 5             | trees of long life span (>150 yrs), fast growth rate. Examples: <i>Cupressus, Platanus, Ficus, Pinus</i>   |
| 6             | trees of long life span (>150 yrs), slow growth rate. Examples: <i>Ulmus, Quercus, Sequoia, Ginkgo, Araucaria</i>  |

**Table 2. Modifier**

|   |  |
|---|--|
| 0 | Normal plant status  |
| 1 | an ubiquitous species (grows like a weed) Example: <i>Salix, Fraxinus rotundifolia, Pittosporum undalatum</i> .  |
| 2 | a rare species in the locality, a special precious cultivated variety, a tree on the "significant tree register" , has special historical or other significances |

**Table 3. Aesthetics Factor**

|   |  |
|---|--|
| 1 | contributes little to the landscape                        |
| 2 | one of a group of close plantings                          |
| 3 | wide plantings   |
| 4 | irregular spacing between trees: regular spacings one side |
| 5 | street or pathway plantings, regular spacing both sides    |
| 6 | solitary feature specimen tree                             |

**Table 4. Locality Factor**

|   | Locality (L)   |
|---|--|
| 1 | in undeveloped bushland or reserves                          |
| 2 | in villages  |
| 3 | in outer suburb areas and residential streets                |
| 4 | in inner city suburbs  |
| 5 | in City Park or Reserve, significant street near City centre |
| 6 | in City Garden or City Centre secondary street               |
| 7 | City Centre Main Street, Principal Boulevard                 |

Table 5. Tree Condition

|   | TREE CONDITION (C) | RATING    |
|---|--------------------|-----------|
| 1 | 6, 7, 8, 9         | very poor |
| 2 | 10, 11, 12, 13     | poor      |
| 3 | 14, 15, 16, 17, 18 | fair      |
| 4 | 19, 20, 21, 22     | good      |
| 5 | 23, 24, 25, 26     | excellent |

# TREE AMENITY VALUATION CALCULATION

CTAV

Tree amenity valuation formula:

$$\text{Value (V)} = \text{Basic Value ($)} \times \text{Species (S)} \times \text{Aesthetics (A)} \times \text{Locality (L)} \times \text{Condition (C)}$$

Tree #

Species

Platanus X acerifolia

Location 250B Darling Street

## Step 1. Determination of Basic Monetary Value (\$)

The basic monetary value of a tree is determined by measuring the trunk diameter at breast height (DBH).  
DBH = 1.4m above ground surface.

DBH

43

Basic Value

18904.61

## Step 2. Determination of species factor (S)

A tree is assessed according to its known natural lifespan and its rate of growth in a particular environment (**Characteristics**). For example a long lived tree will be scored higher than a short lived tree. Significant features to the tree will also modify how the tree is scored. Judgement regarding species factor must be made by a qualified arborist.

Characteristics

Table 1 trees of short life span (<50yrs), Fast growth. Examples: Prunus, Acacia, Virgilia, Laburnum

Character value

0.5

Modifier value

Table 2 Normal plant status

Modifier value

0

Total S factor

0.5

## Step 3 Determination of aesthetics factor (A)

The aesthetic value of a tree is determined by the impact on the landscape if the tree was removed. This category is closely tied to the locality factor (L), see Step 4.

Aesthetics

Table 3 wide plantings

Total A factor

0.7

#### Step 4. Determination of Locality factor (L)

The locality factor is determined by the tree's geographical situation. Trees in the CBD or a major arterial road (urban) score highest because of the stressful growing environment that the tree has to survive in. As the locality becomes more rural the significance of the location of the tree diminishes.

| Locality       |   |  |
|----------------|---|--|
| Table 1        | 3 in outer suburb areas and residential streets |  |
| Total L factor | 1.5   |  |

#### Step 5. Determination of Tree Condition ( C )

Tree condition value is determined by the corresponding total score of the assessment criteria.

| Condition        |                                    | Score |
|------------------|------------------------------------|-------|
| Trunk            | Solid and Sound                    | 5     |
|                  | Sections of bark damaged / missing | 3     |
|                  | Extensive Decay, hollow trunk      | 1     |
| Growth           | >15cm twig elongation this season  | 3     |
|                  | 5 to 15 cm twig elongation         | 2     |
|                  | < 5 cm twig elongation             | 1     |
| Structure        | Healthy, stable and sound          | 5     |
|                  | Some deadwood and dead limbs       | 3     |
|                  | Extensive dieback and deadwood     | 1     |
| Pests & Diseases | No pest / disease infestation      | 3     |
|                  | Minor symptoms of infestation      | 2     |
|                  | Advanced symptoms of infestation   | 1     |
| Canopy Developm  | Full balanced canopy               | 5     |
|                  | Full but unbalanced, lop – sided   | 3     |
|                  | Unbalanced and lacking full canopy | 1     |
| Life Expectancy  | > 50 years                         | 5     |
|                  | 10 – 50 years                      | 3     |
|                  | < 10 years                         | 1     |
|                  |                                    | 18    |

|                |     |
|----------------|-----|
| Total C Factor | 0.6 |
|----------------|-----|
